Distribution Engineering

Methods of water distribution.

Water is distributed to the consumer in several different ways. The methods are. Direct pumping; In this method the pumps force water direct into the mains with no other outlet than the water actually being used. It is a least desirable system as a power failure would result in the no availability of water.

Water Distribution System. The basic requirements of pipes for water distribution system are adequate strength and maximum corrosion resistance. Cast iron, cement-lined steel, plastic, and asbestos-cement compete in the small sizes, while steel and reinforced concrete are competitive in the larger sizes.

Water Distribution System - Its Design, Types, & Requirements. The process of distributing treated water to the consumers is called water distribution system. The distribution system includes pumps, reservoirs, valves, water meter, pipe fittings, etc. The cost of the distribution system is about 40-70 % of the total of the entire scheme. A good water distribution

A water-distribution pipe is located inside a building and delivers potable water to the fixtures. The supply system delivering water from the potable source to the building is the "water service" pipe. The water distribution system includes normally both hot and cold water. The temperature range limits the materials allowed.
